

Carriage Rollers

Carriage Rollers - Carriage rollers are specially designed bearings which are used on lift masts in order to help them perform in challenging environmental surroundings. Lift masts are normally subjected to shocks, oscillations, vibrations and high dynamic and static loads. This apparatus is regularly exposed to environmental influences like for instance heat, dust, cold, contamination, aggressive ambient air and moisture. Therefore, the lift masts' guidance arrangements need to be particularly strong and have a particular high load carrying capacity.

In order to help compete in many various environmental surroundings, carriage rollers were designed for several lift masts. While having the ability to handle a particularly high load carrying capacity, these bearings provided a cost-effective operational security for the lift masts' guidance arrangements.
