

## Forklift Fork Positioners

Forklift Fork Positioner - A fork positioner is actually a device constructed out of top quality materials meant to be able to withstand the most challenging operations and work environments. This particular piece of equipment can enable drivers to be able to control the blades hydraulically without leaving the seat. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate much more precise carrying and position in a quicker and more effective method.

The fork pocket is rather unique and enables the operator to be able to safely swing the forks into position without any fear of destroying the positioning cylinders. This could allow the driver the alternative to be able to execute simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into fork positioners on existing units.
